

Importance of bowel barrier function in IBD

Jean-Frederic Colombel, MD

Director of The Susan and Leonard Feinstein IBD Clinical Center
and The Leona M & Harry B Helmsley Charitable Trust IBD Center

Icahn School of Medicine, Mount Sinai Hospital
New York

**Mount
Sinai**

Conflicts of interest

Jean-Frederic Colombel has served as consultant, advisory board member or speaker for AbbVie, Amgen, Boehringer-Ingelheim, Celgene Corporation, Celltrion, Enterome, Ferring, Genentech, Immunic, Janssen and Janssen, Lilly, Medimmune, Merck & Co., Pfizer, Protagonist, Second Genome, Seres, Shire, Takeda, Theradiag, Theravance Biopharma.

Speaker for

AbbVie, Ferring, Pfizer, Takeda, Shire

Speaker's bureau for

Amgen

Stock options:

Intestinal Biotech Development, Genfit

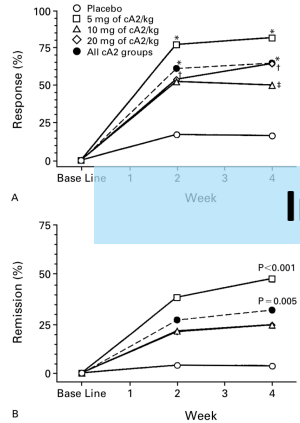

Research Grants:

AbbVie, Takeda, Janssen and Janssen

Pivotal Crohn's Disease Trials: Anti-TNF Naïve Population with anchoring

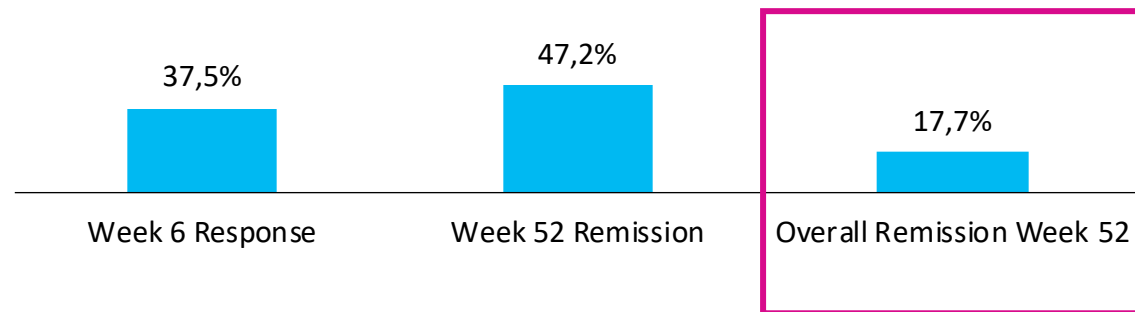

CHARM – Adalimumab

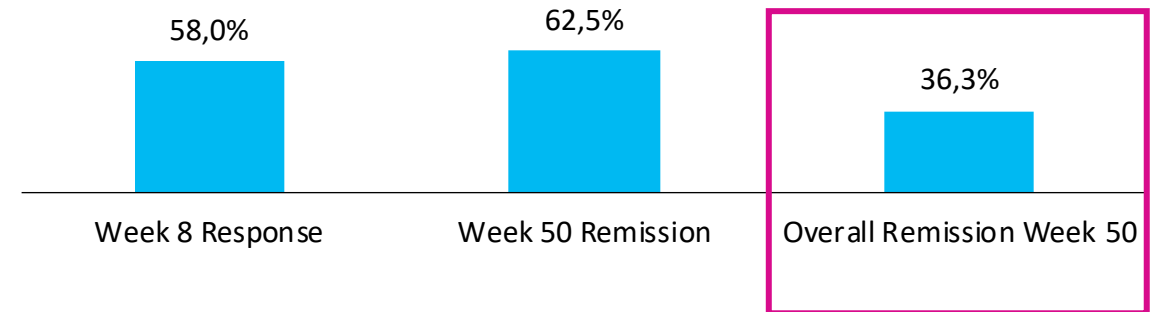

ACCENT I – Infliximab

GEMINI II – Vedolizumab

UNITI-2 – Ustekinumab*

- VDZ Q4W or Q8W for maint.

- 130 mg with 47% and 6 mg/kg with 58% response rate
- 50 weeks 90 mg/Q12 at 56.9% and Q8 at 62.5%

IBD childhood mortality: 2019

Mortality in childhood-onset inflammatory bowel disease (IBD)

Non-IBD

IBD

Deaths in childhood-onset IBD and matched general population reference individuals during 20 years of follow-up

Gastroenterology

Risk of lymphoma in IBD

Nation wide French cohort of 189289 patients

Table 3. HRs Comparing the Risk of Lymphoma in Patients Exposed to Thiopurine Monotherapy, Anti-TNF Monotherapy, and Combination Therapy vs Unexposed Patients

Lymphoma Type	Exposed to Thiopurine Monotherapy vs Unexposed to Thiopurines or Anti-TNF Agents		Exposed to Anti-TNF Monotherapy vs Unexposed to Thiopurines or Anti-TNF Agents		Exposed to Combination Therapy vs Unexposed to Thiopurines or Anti-TNF Agents	
	Crude HR (95% CI)	Adjusted HR (95% CI) ^a	Crude HR (95% CI)	Adjusted HR (95% CI) ^a	Crude HR (95% CI)	Adjusted HR (95% CI) ^a
All Patients						
All lymphoma	2.06 (1.58-2.70)	2.60 (1.96-3.44)	1.57 (1.08-2.28)	2.41 (1.60-3.64)	3.60 (2.10-6.19)	6.11 (3.46-10.8)
Hodgkin lymphoma	2.78 (1.45-5.33)	2.83 (1.37-5.84)	2.21 (0.92-5.35)	2.23 (0.81-6.13)	11.4 (4.76-27.2)	12.1 (4.46-33.1)
Non-Hodgkin lymphoma	1.95 (1.45-2.62)	2.57 (1.90-3.49)	1.47 (0.97-2.22)	2.48 (1.58-3.89)	2.38 (1.17-4.84)	4.48 (2.15-9.34)
Patients With Incident IBD						
All lymphoma	1.58 (0.84-3.00)	2.35 (1.16-4.75)	0.98 (0.39-2.48)	1.49 (0.54-4.12)	3.14 (1.13-8.71)	5.90 (1.79-19.4)

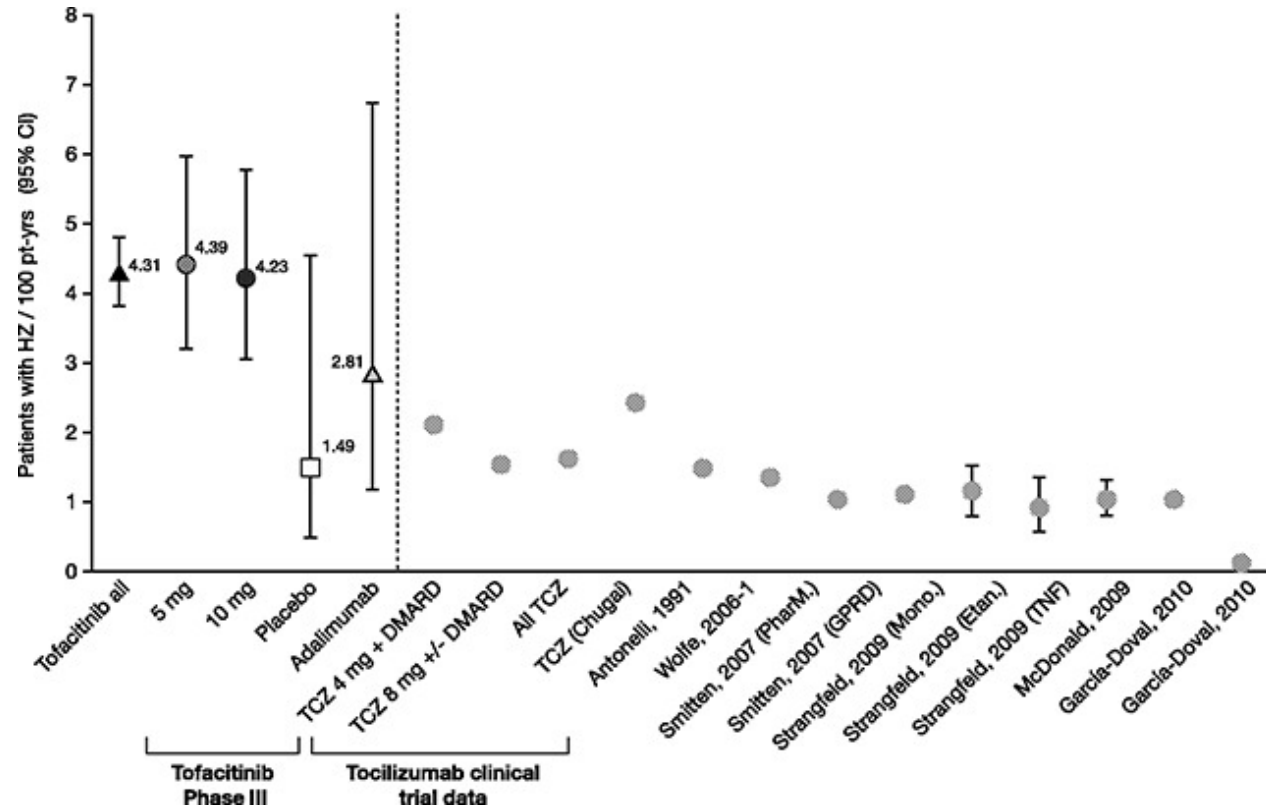

Abbreviations: HR, hazard ratio; IBD, inflammatory bowel disease; TNF, tumor necrosis factor.

^a Multivariable Cox model adjusted for baseline characteristics including sex, age, affiliation to Complementary Universal Health Insurance, IBD diagnosis

and duration, exposure to methotrexate and aminosaliclates, comorbidities and time-dependent covariates including exposure to corticosteroids, and IBD-related hospitalizations and surgical procedures.

Main Risk of Novel JAK-Inhibitors

4-in-100 Treatment Years Zoster Reactivation

Reference: Winthrop et al. Herpes Zoster and Tofacitinib: Clinical Outcomes and the Risk of Concomitant Therapy. *Arthritis Rheumatol.* 2017;69(10):1960-1968.

Crude incidence rates of herpes zoster (HZ) in the Tofacitinib Rheumatoid Arthritis (RA) Development Program (left of broken line) and in published studies of patients with RA treated with nonbiologic and biologic disease-modifying agents (right of broken line)

Impaired Response to Vaccines During IBD Therapy with Immunosuppressants

Table 3. **Pneumococcal Vaccine (PPSV23) in IBD**

	Controls ^a	Azathioprine	Infliximab	Combined ^b
Total population (N)	35	19	26	16
Dose/duration before baseline	N/A	2-2.5 mg/kg for at least 24 wk	5 mg/kg for at least 16 wk	Same
Response rate (P-value)	88.6% (N/A)	78.9% (P = .43)	57.7% (P = .008)	62.5% (P = .02)
Average antibody titer vs. baseline	5.71-fold increase	3.25-fold increase	2.69-fold increase	2.84-fold increase

^a Control: anti-inflammatory, but not immunosuppressant therapy (e.g., mesalamine).

^b Combined: azathioprine plus infliximab, same doses.

N/A: not applicable; IBD: inflammatory bowel disease (Crohn's disease and ulcerative colitis).

What gastroenterologists want!

Crohn's disease

- 10-40% of moderate-severe patients do not respond to any remission induction therapy
- 24–46% develop secondary loss of response within the first year after drug-induced remission or surgery
- ~10% stop maintenance treatment due to adverse drug reactions or tolerability issues

Physician ranked unmet needs in CD:

1. **Agents to maintain remission without immunosuppression**
2. An effective treatment for fistulizing disease
3. Predicting response to biologic therapy
4. An effective cost-saving nonbiologic
5. Better activity measures in clinical trials
6. Drugs targeted for the mild patient population

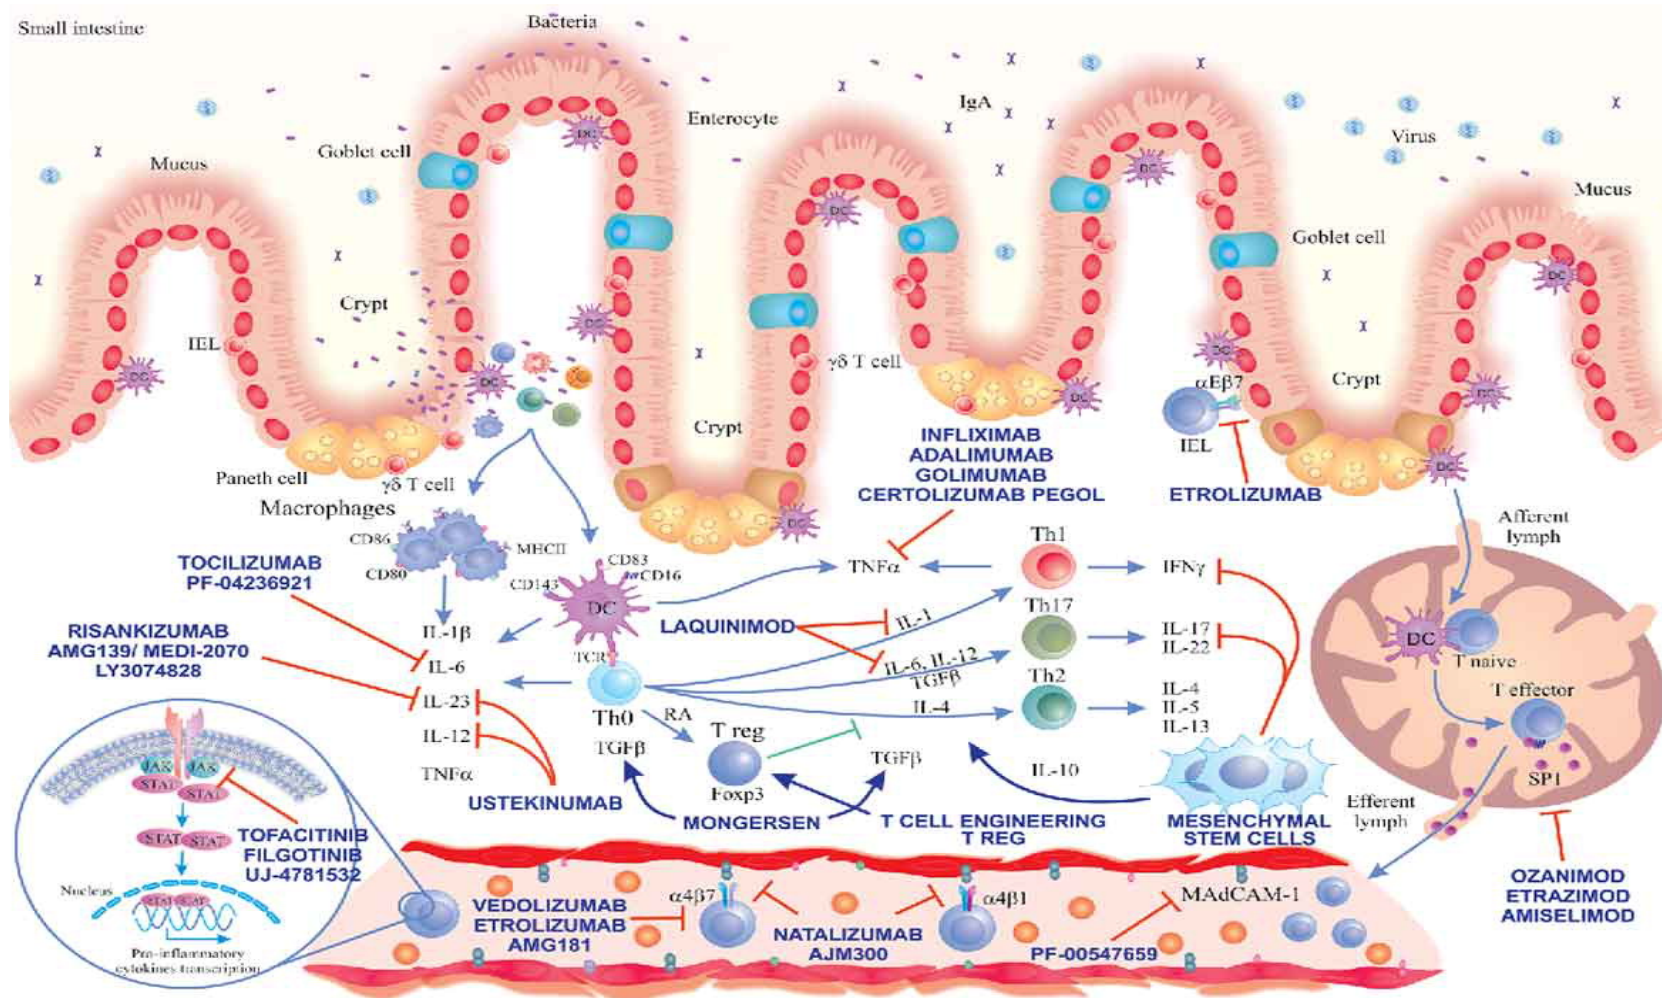

Ulcerative colitis

- ~30% patients are primary non-responders (PNR) to anti-TNF biologics
- ~15-30% lose response (LOR) over time or become intolerant to anti-TNFs
- PNR patients are less likely to respond to 2nd-line therapy as compared to patients with prior loss of response or intolerance

Physician ranked unmet needs in UC:

1. A well-tolerated treatment for inducing remission quickly
2. Effective treatments for refractory patients
3. **A non-steroid oral maintenance drug**
4. Disease-modifying drugs
5. An effective cost-saving nonbiologic
6. Simple blood tests that indicate disease activity

The expanding IBD pipeline: most targeting immune system!

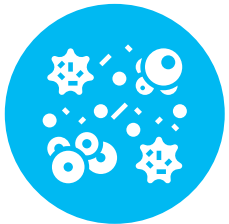

Need for new therapeutic options in IBD

That allow the long-term treatment of gastrointestinal diseases without impairing the immune system

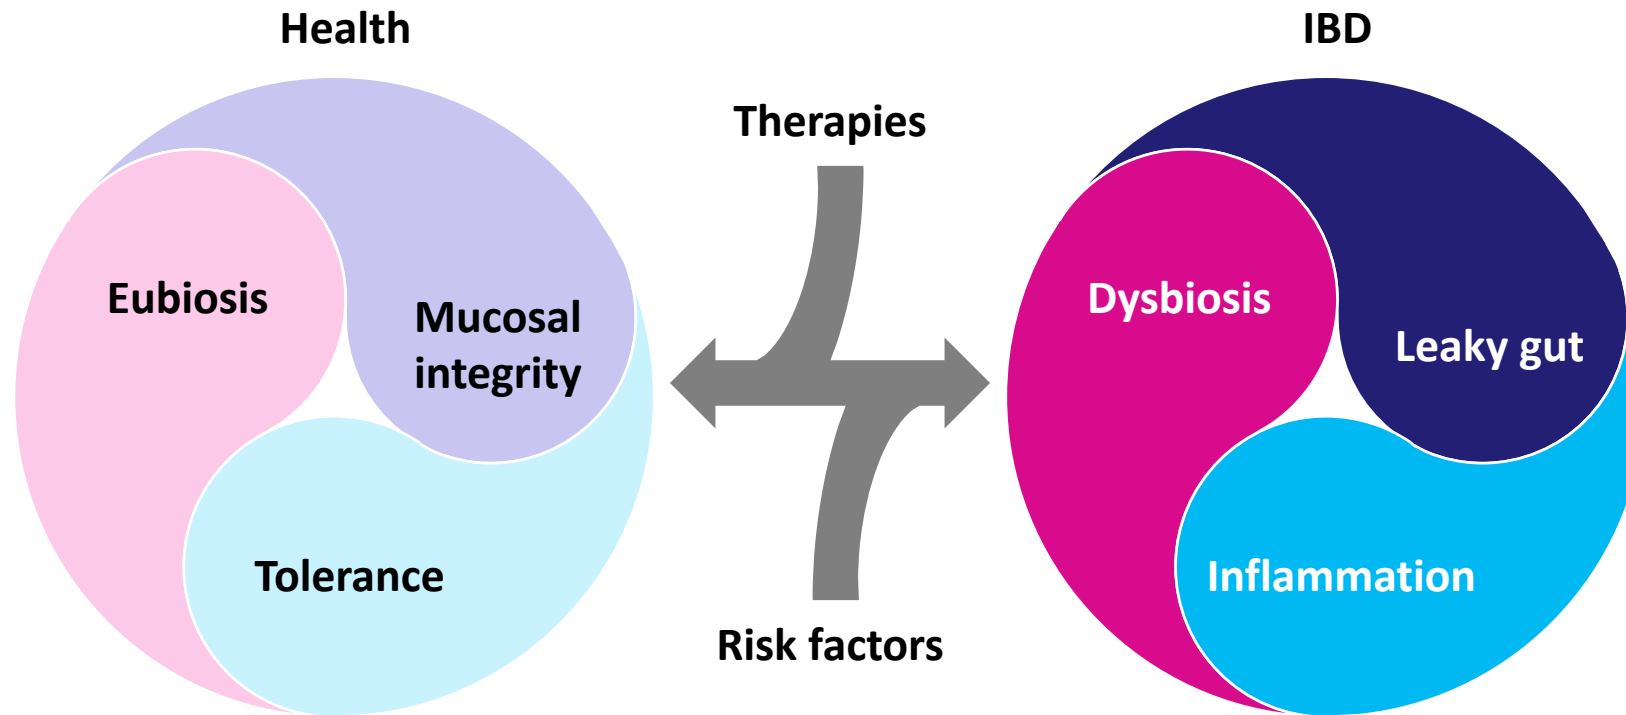

Concept of bowel permeability is central to many gastrointestinal diseases

Impaired bowel barrier function allows the microbiome to interact with the immune system

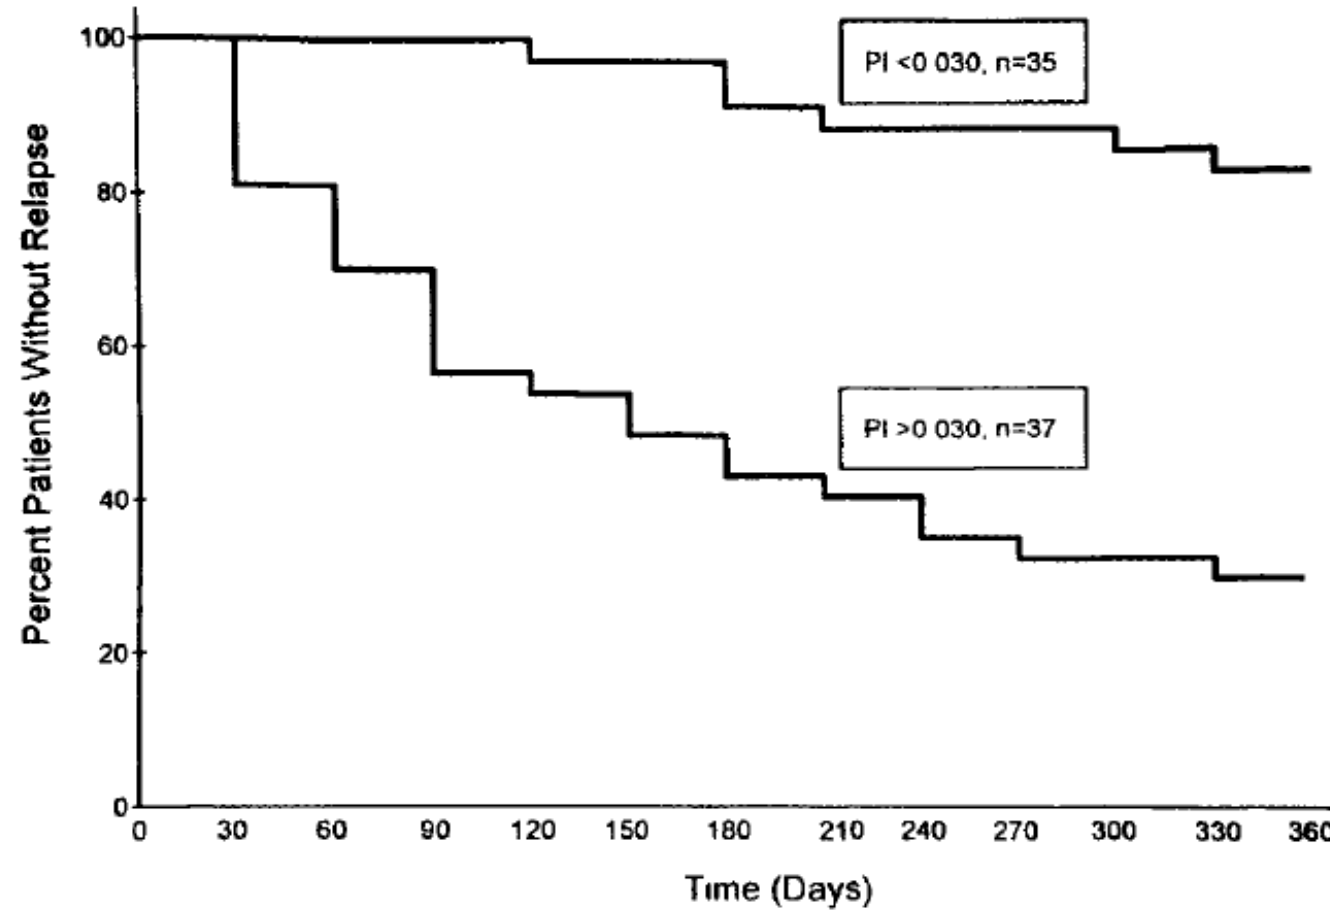

The tripartite pathophysiological circuit of IBD

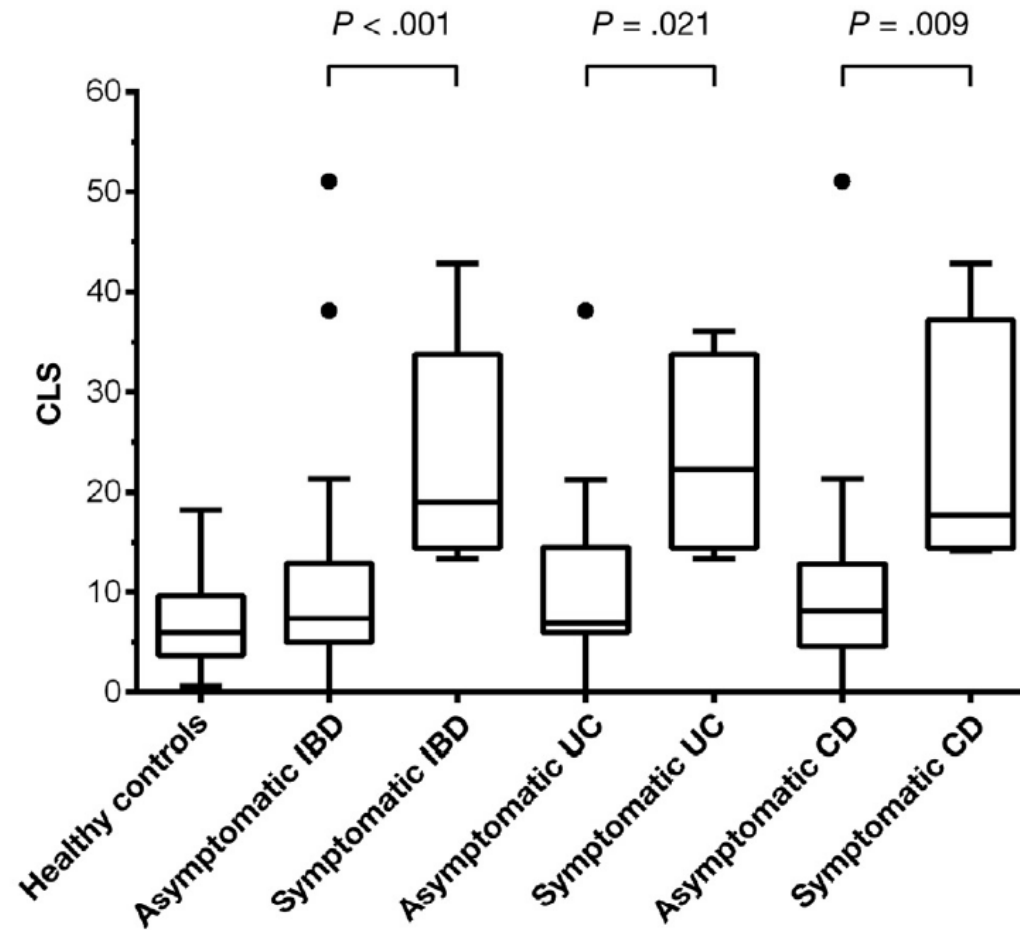

The tripartite pathophysiological circuit of inflammatory bowel disease (IBD)

Dysfunction in each of these physiological components (dysbiosis, leaky gut, and inflammation) contributes in a mutually interdependent manner to IBD onset and exacerbation. (Vindigni et al. 2016)

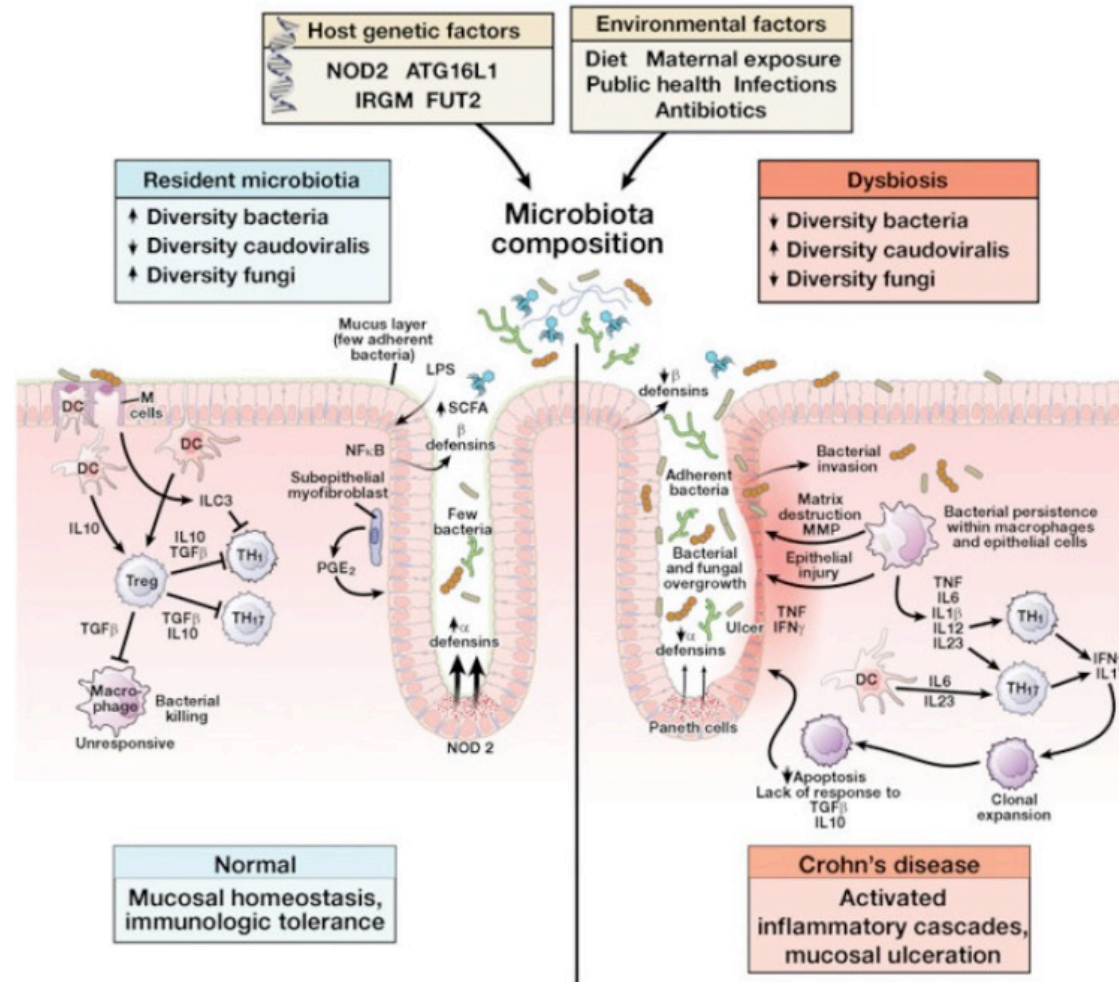

Crohn's disease – patient with increased bowel permeability have higher probability for relapse

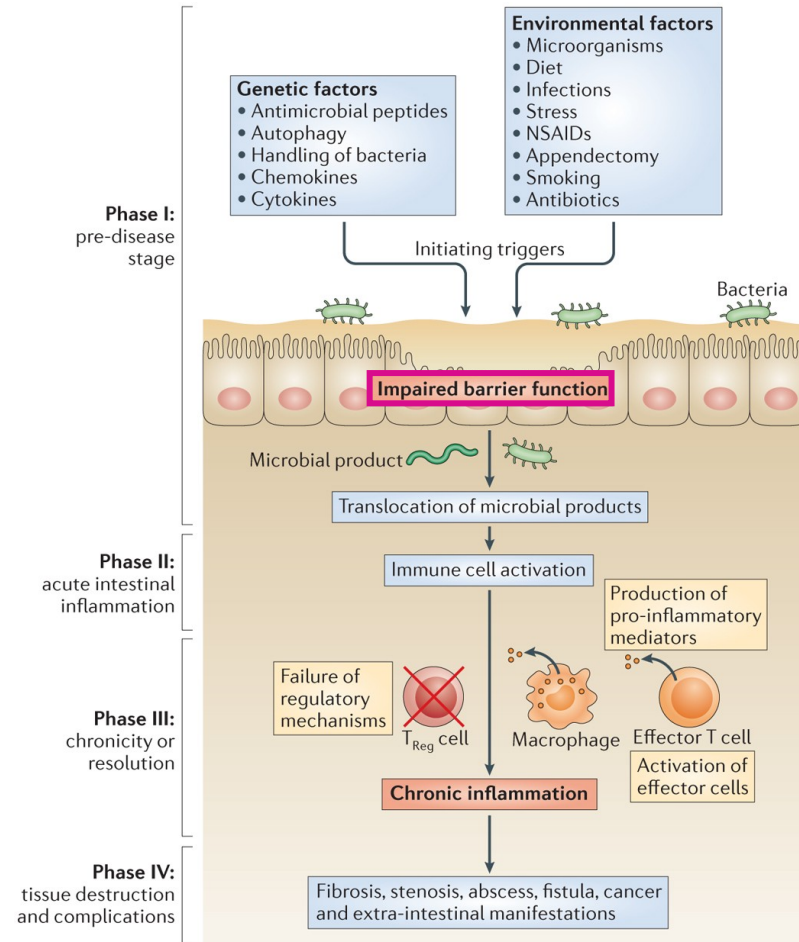

CD/UC– high bowel permeability correlates with symptoms

Early events in IBD: dysbiosis, altered IP?

Presumed Trigger for IBD: Bacterial penetration through weakened tight junctions causes immune overstimulation

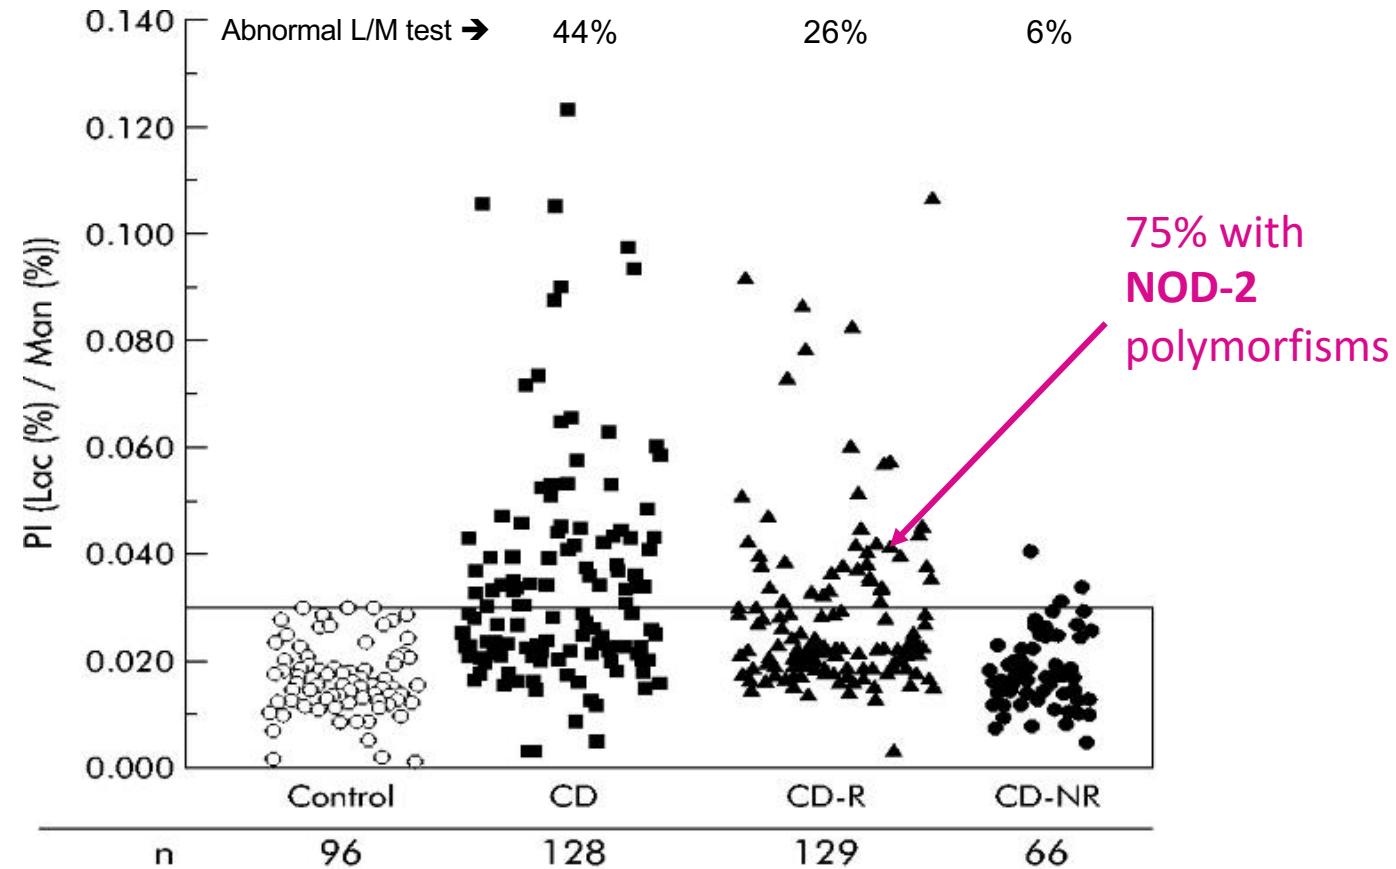

Reference: Neurath MF. Cytokines in inflammatory bowel disease. Nat Rev Immunol. 2014 May;14(5):329-42.

Enhanced *E. coli* LF82 Translocation through the Follicle-associated Epithelium in Crohn's Disease is Dependent on Long Polar Fimbriae and CEACAM6 expression, and Increases Paracellular Permeability

First degree relatives IBD patients have increased intestinal permeability

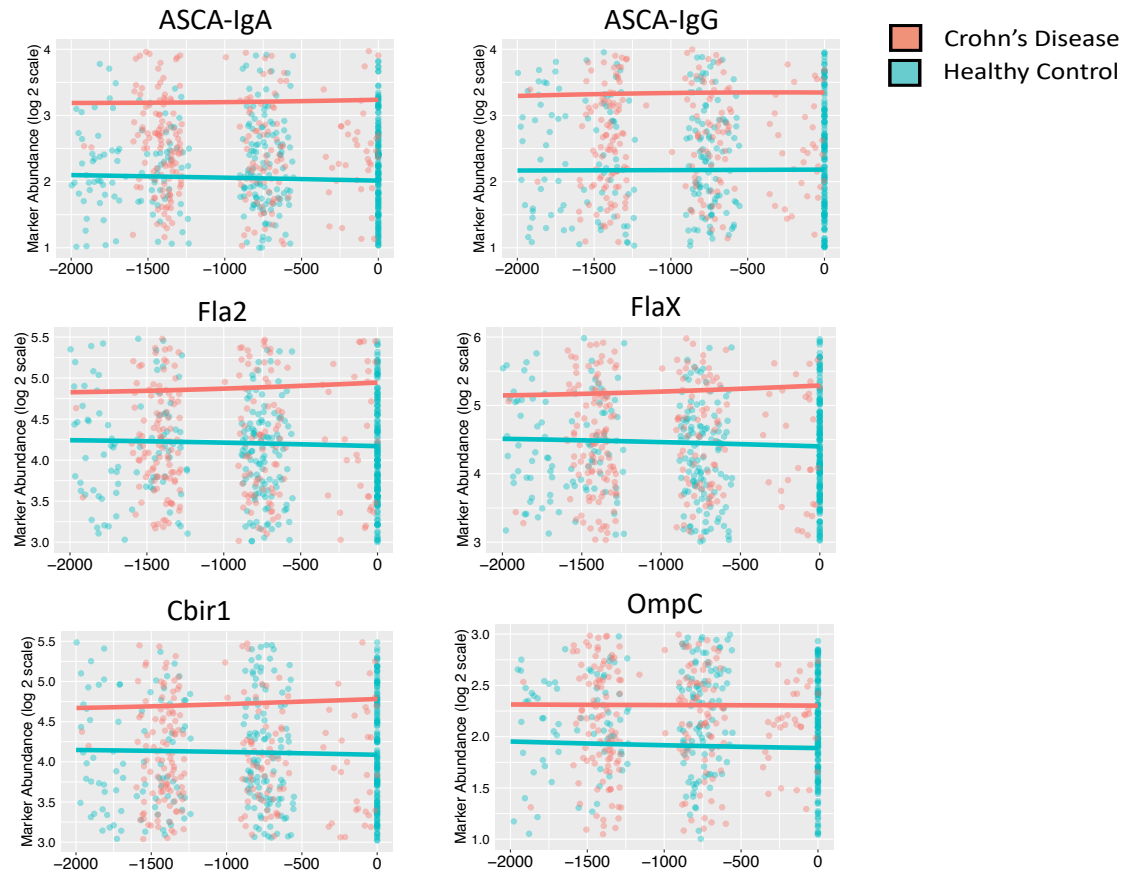

CD - Crohn's disease (CD)
 CDR - first degree relatives
 CD-NR - non-blood relatives

The rationale: IBD as other immune-mediated diseases have a preclinical period that can be targeted

Crohn's disease: Anti-microbial markers are elevated many years before diagnosis

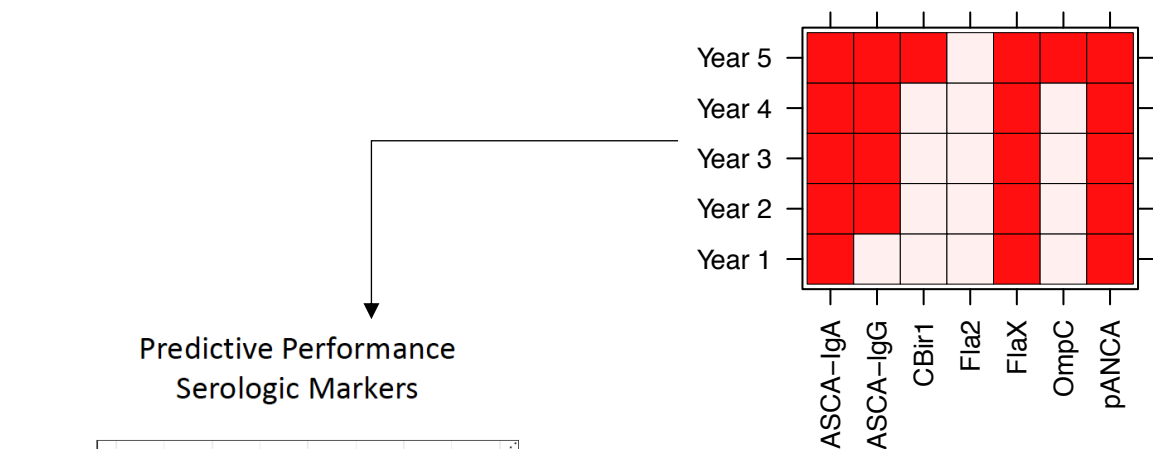

Time-varying trajectory of antimicrobial antibodies*

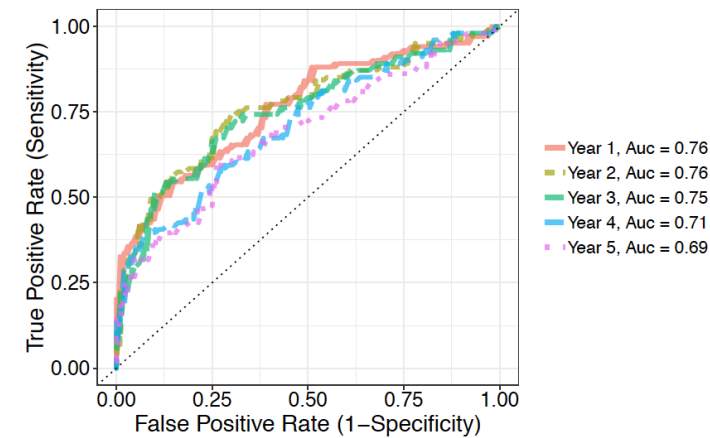

Univariate analysis

* Derived using functional PCA in training data and evaluated in the testing data
 Torres J et al. Gastroenterology 2020

Selected markers (multivariate analysis)

Predictive Performance Serologic Markers

Multivariate analysis

The GEM project

Find 75 healthy subjects who go on to develop disease
and compare with healthy subjects

75 new cases and 300 controls

Risk of Crohn's in FDR = 0.3% per year

5000 healthy Sibs
and Offspring

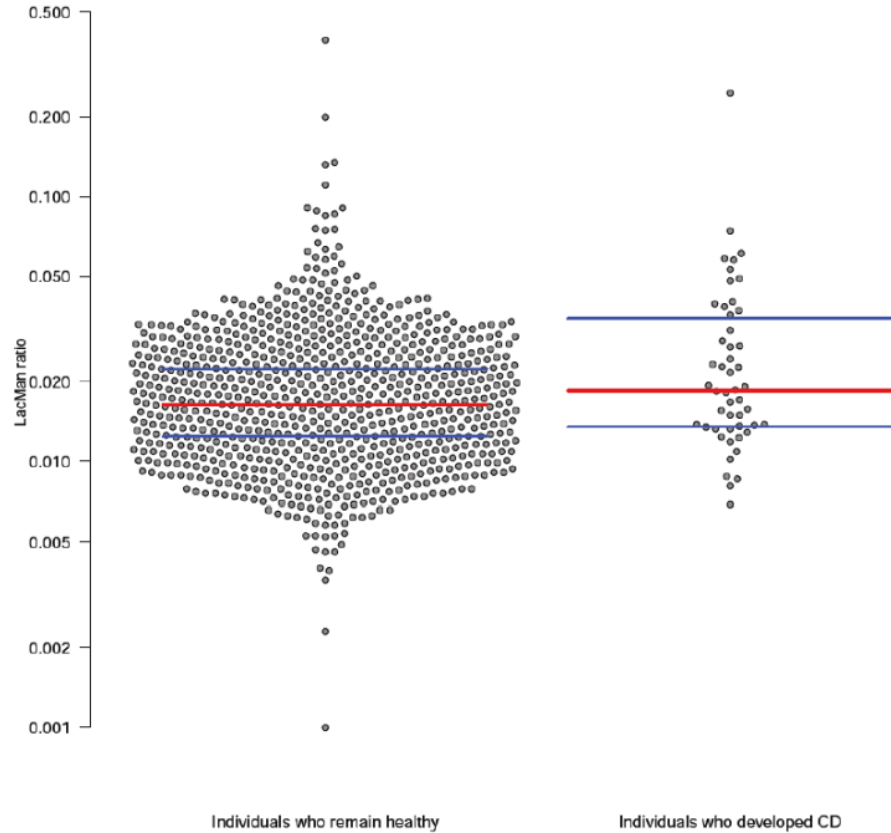

Completed

Being from multiplex family, intestinal permeability and microbiome diversity may be risk factors for development of CD

Increased IP precedes development of Crohn's disease

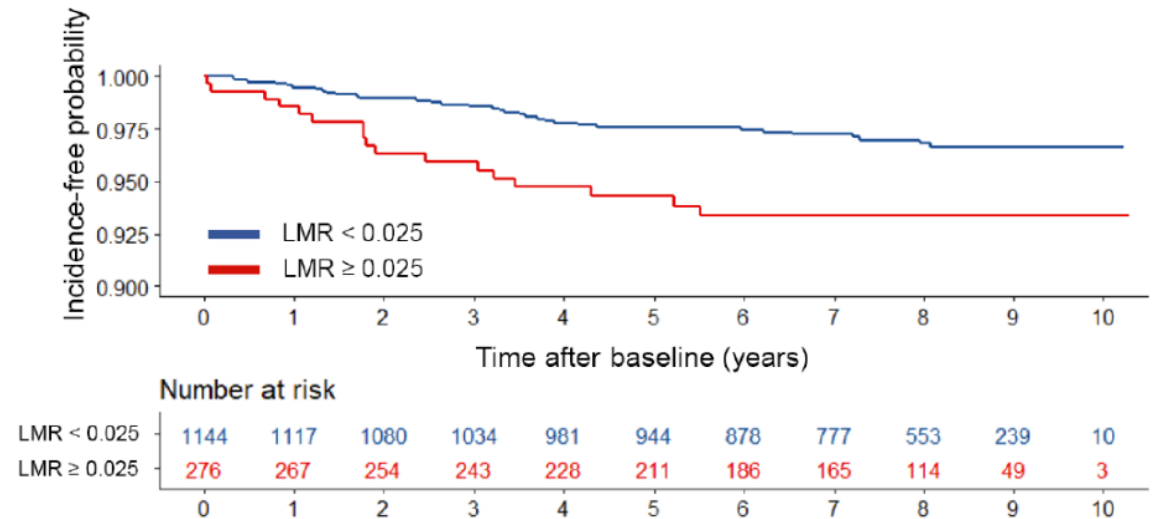

Follow up of 1420 FDRs – 50 developed IBD

LMR test

Courtesy K Croitoru

Risk of developing CD

HR : 3.03 CI (1.94-5.63)

Discussion: Potential use in Crohn's Disease

01

Mild CD disease

- The “mesalazine” of CD?

02

Post-operative setting

- Endpoint: avoid recurrence of local disease

03

Maintenance of remission in CD

- Monotherapy in remission
- Combination therapy in active disease

04

Prevention?
